N-PSDB;

Modulating level of metabolites and stress resistance in recombinant cells for synthesis of plant metabolites such as alkaloids including terpenoid indole alkaloids, by providing transcription factor to the cell.

Disclosure; Page 97-98; 101pp; English.

Many plant secondary metabolites have value as pharmaceuticals, food colourings, flavours and fragrances. Some plant secondary metabolites are linked to plant or plant cell defence mechanisms and may confer to the plant antimicrobial activity, protection against UV light, herbivores, pathogens, insects and nematodes. Plant secondary metabolites such as terpenoid indole alkaloids (TIA) represent a class of pharmaceutically useful compounds which naturally occur in many plant species. New methods are described which modulate the expression of one or more genes involved

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      in the biosynthesis of plant metabolites or their precursors in plant cells. The method comprises inserting into a plant cell a sequence encoding a transcription factor comprising an AP2 DNA-binding domain and by modifying the expression of that transcription factor. Transcription factors comprising an AP2 DNA-binding domain are useful as central regulators of complex metabolite pathways involving numerous target genes for such transcription factors. This means that the yield of commercially valuable metabolite compounds can be enhanced and the tolerance of plants towards exogenous stress factors can be influenced. The method is useful for modulating the level of one or more metabolites. By providing a transcription factor to the cell the level of the metabolite is enhanced by at least 10%, 25% or 100% or reduced 10%, 25%, 50% or 90% relative to a cell to which the transcription factor is not provided
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 secondary metabolite modulator; biosynthesis; alkaloid; phenylpropanoid; tobacco; Nicotiana tabacum variant bright yellow; Nicotiana tabacum BY;
                       New isolated polypeptides and polynucleotides useful for biosynthesis of secondary metabolites (e.g. alkaloids or phenylpropanoids) in an organism or its cell.
                                                                                                                                                                                                                                                                                                                                                                                          17-MAY-2002;

The polypeptide is selected from a polypeptide encoded by a polynucleotide comprising any of the 871 nucleotide sequences given in the specification. The polypeptides and polynucleotides are useful in modulating the biosynthesis of secondary metabolites (e.g. alkaloids or phenylpropanoids) in an organism or its derived cell. The present sequence is used in the exemplification of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          xaaaaaaaaaaaaaaaaaaaaaaaaaax x
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CC Many plant secondary metabolites have value as pharmaceuticals, food CC colourings, flavours and fragrances. Some plant secondary metabolites are CC linked to plant or plant cell defence mechanisms and may confer to the CC plant antimicrobial activity, protection against UV light, herbivores, CC plant antimicrobial activity, protection against UV light, herbivores, CC pathogens, insects and nematodes. Plant secondary metabolites such as CC terpenoid indole alkaloids (TIA) represent a class of pharmaceutically CC useful compounds which meturally occur in many plant species. New methods in the biosynthesis of plant metabolites or their precursors in plant CC cells. The method comprises inserting into a plant cell a sequence CC encoding a transcription factor comprising an AP2 DNA-binding domain and by modifying the expression of that transcription factor. Transcription factors comprising an AP2 DNA-binding domain are useful as central CC regulators of complex metabolite pathways involving numerous target genes for such transcription factors. This means that the yield of commercially CC valuable metabolite compounds can be enhanced and the tolerance of plants CC towards exogenous stress factors can be influenced. The method is useful CC for modulating the level of one or more metabolite. By providing a CC transcription factor to the cell the level of the metabolite is enhanced CC by at least 10%, 25% or 100% or reduced 10%, 25%, 50% or 90% relative to CC a cell to which the transcription factor is not provided
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                factor. This movel transcription factor is useful for modifying a plant's compensation desirable ways, such as modifying a plants environmental stress. The transcription factor is encoded by environmental stress colerance gene derived from Arabidopsis thaliana. The transcription factors and the genes encoding them are used to alter the structure and developmental characteristics of plants such as soybean, wheat, corn, cotton, rice, oilseed rape, sunflower, alfalfa, sugarcane, turf, potato, cotton, rice, oilseed rape, sunflower, alfalfa, sugarcane, turf, canliflower, coffee, onlon, cucumber, eggplant, grapes, honey dew, calliflower, coffee, onlon, cucumber, eggplant, grapes, honey dew, coulting, melon, papaya, peas, peppers, pineapple, spinach, squash, sweet corn, tobacco, tomato, watermelon, rosaceous fruits and/or vegetable brassicas. These sequences are also used for modifying traits associated with environmental stress tolerance, such as freezing, chilling, heat, drought, water saturation, salt, photoconditions, cradiation and ozone. The transcription factors are used in gene therapy

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a number of cDNA sequence and their encoded proteins which are especially transcription factor cDNAs and their proteins. The isolated or recombinant polynucleotide is useful for proteining a modified plant with a modified trait, e.g. enhanced tolerance to environmental conditions, improved tolerance to microbial, fungal or viral diseases, improved tolerance to pest infestation, decreased herbicide sensitivity, improved tolerance of heavy metals, or enhanced ability to take up heavy metals, improved growth under poor photoconditions, improved nutrient uptake, or reduced hormone sensitivity. The transgenic plants are useful for growing a progeny plant comprising the desired trait. The polynucleotides and polypeptides are also useful in bioinformatic search methods. This sequence represents one of the proteins of the invention.
                                                                   glyphosphate tolerance; hormone sensitivity; disease resistance; sugar sensing; flowering; flower structure; stem bifurcation; branching pattern; apical dominance; trichome; stem morphology; root growth; root hair; seed development; cell proliferation; cell differentiation; premature senescence; necrosts; plant size; leaf morphology; seed morphology; seed biochemistry; root anthocyanin; plant anthocyanin; light response; shade avoidance; bioinformatic;

                                                                        Ś
                                                                                                                                                           밁
                                                                                                                                                                             The invention describes a transgenic plant comprising a recombinant comply production of any one of more than 500 nucleotide sequences fully confidence in the specification or its complement. The method of the convention can be used to produced a plant having altered traits such as: consitivity; disease resistance; sugar sensing; early or late flowering; considered flower structure, change in stem bifurcations, altered branching pattern, reduced apical dominance, reduced trichome density; lack of contributions; reduced ectopic trichome development; altered branching trichomes; reduced ectopic trichome number; altered stem morphology; concreased root growth; increased root hairs; altered seed development; considered ell proliferation or cell differentiation; rapid development; considered cell proliferation or cell differentiation; rapid development; considered plant size; leaf morphology; seed morphology; seed biochemistry; increase in root anthocyanins; increase in plant containts, or alteration in light response or shade avoidance. The containts cearch methods. This is the anino acid sequence of a plant transcription factor that can be used in the creation of a transgenic containt with altered traits.
                                                                                                     Matches
                                                                                                                               Query Match
                                                                                                                                                          Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New transgenic plant comprising a recombinant of more than 500 nucleotide sequences, useful

New transgenic plant, useful in developing improved characteristics or traits. phenotypes with altered

Claim 1; SEQ ID NO 28; 213pp; English

Constitutive, inducible or tissue-specific promoter and a recombinant constitutive, inducible or tissue-specific promoter and a recombinant complynucleotide described above), a bost cell comprising the expression cassette, producing a modified that having a modified that it, identifying a factor that is modulated by or interacts with a polypeptide encoded by the polynucleotide sequence that is subject to a regulatory effect of any of the polynucleotide sequence and identifying at least one downstream polynucleotide sequence that is subject to a regulatory effect of any of the polynucleotide described above. The transgenic plant is useful for producing a plant that has an altered trait, e.g. an enhanced to learance to about stress (increased tolerance to chilling, germination in cold conditions, freezing tolerance to to heat, tolerance to phosphate limitation, tolerance to somotic stress, tolerance to salt, colerance to otherance, discred susceptibility to selection tolerance and the sending of the polynucleotide described above. The crapme to ethylene, disease resistance, altered susceptibility to susceptibility to part of the polynucleotide sending the period of flowering, an inflorescence architectural clange, a change in the middle seed germination and seedling vigor, early flowering, late flowering, axended germination and seedling vigor, early flowering, late flowering, axended germination and seedling vigor, early flowering, late flowering, axended germination and seedling vigor, early flowering, late flowering, axended germination and seedling vigor, early flowering, late flowering, axended germination and seedling vigor, early flowering, late flowering, axended germination and seedling vigor, early flowering, late flowering, axended general flowering, attered seed derelopment, increased lateration, premature sensescence, delayed to stem blight to flowering, an increased necrosis, an increase in seed dividual seed of producing and seed sort in seed in school and seed size, clange in seed seed sortent, ch sequence comprising a sequence encoding a polypeptide, that initiates transcription (i.e. a transcription factor) from Arabidopsis, Soybean, Rice, Rape or Corn, comprising any of the sequences appearing as ADO01588 -ADO03527 or ADO03530-ADO03559. Also included are using a transgenic Sequence 226 light The thalecress transcription polynucleotide having response B relates yanins, increase in plant anthocyanins, or shade avoidance. The present sequencescription factor of the invention. a polynucleotide sequence or to a transgenic plant comprises quence or its complementary polypeptide, that initiate polypeptide, that initiaters) from Arabidopsis, Soybean sequence represents a recombinant

The proteins of the invention include calcium dependent protein kinase (CDPK), nematode-responsive transcription factor 1 (NRTF1), nematode-responsive protein (NRP), caffeic acid 7-0-methyltransferase (70M) or inositol 5-phosphatase (IPP) polypeptides. The nucleic acid molecule encoding the polypeptides are operably linked to a promoter that drives expression in a host cell. The composition and methods are useful for conferring or improving nematode resistance in plants. The present sequence represents a soybean NRTF1c polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated nucleic proteins, useful for
